File Size (B)	Transfer Time (sec)	
256	0.194	
10^{3}	0.244	
10^{4}	0.229	
10^{5}	0.258	
10^{6}	0.447	
10^{7}	2.561	
10^{8}	19.465	
10^9	276.923	

- 1) The trend makes sense.
- 2) The main bottleneck is that file messages are limited by the buffer capacity, which itself is limited by the physical memory of the machine. Since only a certain number of bytes may be transferred at a time, the execution time will increase based on how many messages are required to reach the target file size.
